Increase Body Awareness While Increasing Your Activity

Ruth Werner

You have to give us credit: as a culture, Americans are incredibly interested in getting fit. We invest every year in new diets, exercise programs, and supplements for weight loss and improved energy. Low-range estimates suggest that Americans spend about \$2.6 billion each year on gym memberships alone.

We also tend to pitch full speed into any given commitment. If we're going to get fit, by golly, we're going to do it now, regardless of how long it took us to get into our current state. We don't do things by half measures, and moderation is not in our nature. So how do we keep ourselves injury-free while honoring our commitment to exercise and get healthy?

sports field seems to appeal to our competitive spirit--especially when we're surrounded by others who all seem to be doing better than we are. Combine this kind of human drive with poorly trained athletic trainers who give bad advice about form, pacing, and effort, and we have a recipe for potential problems.

Exercise is only effective when it occurs without injury. Any new exercise program requires some caution, even if it is comparatively easygoing. And more challenging programs are safest and most successful when new participants build up their activity levels carefully and receive excellent guidance about form.

WHEN IT GOES WRONG

Moderation is key when beginning a new exercise program

DOES IT HAVE TO BE ALL OR NOTHING?

We all know that starting an exercise program doesn't actually mean we'll finish it. When we throw ourselves into an ambitious new routine, we are likely to overdo it and get hurt. Then, we get discouraged, and may give up entirely, only to start the cycle over in another year or so.

Overdoing things in the gym or on the

injuries throughout our entire lifespans. In the best circumstances, they heal well, with a minimum of internal scar tissue, and function returns to practically normal levels. When things are ideal, that sprained ankle you got playing soccer at age 12 doesn't affect your ability to walk in your 30s. The lumbar

strain you got from picking up the heavy laundry basket 15 years ago resolved well, so at 62, it won't hinder your golf game. We are able to adapt to minor injuries, and we learn how not to exacerbate them.

But when we introduce a new exercise program, especially if that exercise program is more demanding, or demanding in different ways than we have experienced before, we risk the flaring up of old injuries. Scar tissue does not have the weight-bearing capacity of healthy muscle or connective tissue. This is when that old sprained ankle may make itself known, and that weakness in your back will definitely have opinions about your new routine. Sometimes you might feel like your new commitment to fitness was not the best idea.

INJURIES CAN HAPPEN ANY TIME

CrossFit is one program that gets a lot of attention because of its reputation for being especially demanding. But any type of exercise can lead to injury if correct form is not observed. Zumba, Jazzercise, and other dance-like programs bring a risk of foot and leg injuries, including sprained ankles, plantar fasciitis, and stress fractures, because the risk for twisting at the knee is so high.

If you aren't paying close attention to your own limits, even yoga can be a source of soft-tissue injury: delayed soreness, problems at the neck and sacroiliac joints, or other injuries. One massage therapist reported seeing several injuries related to a prolonged yoga headstand, probably in a student who was not ready for this challenge.

HOW CAN MASSAGE HELP?

Massage can help you deal with pain or soreness from your exercise regimen and can also help shorten recovery periods so you can train more efficiently. Although massage therapists are not primary care providers, and cannot diagnose conditions or prescribe specific treatments, your therapist may be able to offer excellent advice for dealing with a fitness-related injury. He or she may also have suggestions about warm-ups, cool-downs, and postexercise stretching, or be able to point you to an appropriate coach or other professional for specific exercise needs and to help prevent future injury.

The incidence of exercise-related injury

has a lot to do with people not paying attention to their own needs. One of the many things massage therapy offers to people who want to become healthier and more fit is the chance to become more aware of your own body in a powerfully positive way. Increased body awareness and self-appreciation may be the best tools for helping you increase activity levels without hurting yourself. In this way, you can reach your goals with power and joy, rather than with pain and injury.

Ruth Werner is a former massage therapist, a writer, and a continuing education provider. She wrote A Massage Therapist's Guide to Pathology (Lippincott Williams + Wilkins, 2013).

Massage can get you back on track following an exercise-related injury

Pre-Session Yoga Moves for Calm

Mary Beth Braun

It's one of those mornings. Your alarm didn't go off and you have an appointment in an hour. How can you quickly collect and calm yourself enough to be fully present for the day ahead? Breath and yoga.

BREATH

Take this time to center and calm yourself. Start by channeling your yoga instructor or massage therapist and begin with breath (pranayama): inhaling to the count of three and exhaling to the count of six. Do this three times and move on to do a few yoga poses (asanas).

YOGA

You remember a few basic yoga poses from class, right? Try these two: simple seated twist and standing half moon.

SIMPLE SEATED TWIST

Continuing to use your breath, sit on the floor in an easy, cross-legged pose and begin simple seated twist. Raise the crown of your head to the ceiling,

elongating your neck and spine. Inhale and exhale, then twist to the left. Exhaling, move through center, and repeat on the right, continuing to inhale and exhale.

STANDING HALF MOON, BIKRAM STYLE

From there, step your right foot forward, followed by your left foot, and slowly roll up one vertebrae at a time until you are standing upright with your feet firmly grounded into the earth.

Feeling your feet firmly grounded, raise your hands overhead, taking the wrinkles out of your neck and elongating your spine. Inhale, exhale, and side bend to the right. Once there, exhale and feel your side body open up as you press your foot into the earth to enhance the stretch. Inhaling through center, exhale and bend to the left. Return to your center and take one more deep breath in and out.

You feel better, right? Now, let go of that harried morning and begin your

day fully present and centered.

Mary Beth Braun is a certified massage therapist based in Indianapolis, Indiana.

Secrets of Sleep

Jed Heneberry

We've all heard it before: get your eight hours of sleep and watch your life improve. But the reason we've all heard it is because it's true, and research keeps showing the importance of sleep and its variety of health benefits.

The National Sleep Foundation says there is no "magic number" of hours for optimum sleep benefits, but that different age groups, and even different individuals, need different amounts of sleep. General recommendations are 7-8 hours per night for adults, while children often need 10-11 hours. Getting less than what you need has been linked to an increased risk of diabetes, heart problems, psychiatric conditions, and more.

Here's a quick look at some new findings that reveal the secrets of sleep, and also

how to get more of it.

- Sleep Suppresses Appetite: Just one night of sleep loss can increase brain activity in the region that contains appetite sensation in response to food images, increasing the long-term possibility of becoming overweight. "Lack of Sleep Makes Your Brain Hungry," The Journal of Clinical Endocrinology Metabolism.

- Naps for Your Noggin: The right side of the brain, which is generally associated with creativity, is active during so-called power naps, while the left brain remains mostly quiet. While it is not clear what exactly is happening during these brief rest periods, researchers suspect the brain is conducting important memory tasks. "Power Naps' May Boost Right-Brain

Activity," Health.com.

- Cherry on Top: Drinking tart cherry juice increased melatonin in study participants, improving sleep efficiency, quality, and time. "Effect of Tart Cherry Juice on Melatonin Levels and Enhanced Sleep Quality," European Journal of Nutrition.
